

Electrifying data

An exclusive series of infographics mapping the commercial EV opportunity in powerful telematics data

How much can you save by going electric?

Fleets that use electric vehicles (EVs) that are connected via Webfleet have saved:

What's happening in your industry?

Reductions per vehicle per year based on business activity

	Mileage	Fuel costs	CO ₂ emissions
Professional services	21,748 mi	€3,429	0,9 tCO ₂
Last mile delivery	36,661 mi	€4,732	8,3 tCO ₂
Passenger transport	54,681 mi	€9,675	36,9 tCO ₂

What's happening in your country?

Average cost savings per vehicle per year based on country

Research methodology

Webfleet conducted this research between January and June 2022. The data from connected cars and vans across Europe was anonymised, aggregated and analysed. The performance of individual customers cannot be tracked. Yearly data was extrapolated from historical data.

Average reduction in net spend is calculated via comparing electric and diesel versions of the same vehicle, for example, Peugeot Expert.

Cost savings are calculated based on the average price of diesel in Europe in H1 2022: € 2.00 per litre.

Fuel reduction is calculated considering (a) in H1 2022, diesel cars and vans connected to Webfleet ran 3.0 billion mi and consumed 607 million litres of diesel and (b) in the same period, electric cars and vans connected to Webfleet ran 43 million mi. The outcomes are calculated based on how much fuel a diesel vehicle would consume traveling those 43 million mi.

CO₂ emissions reductions are calculated based on 1 litre of diesel fuel being used equalling 2.65kg of CO₂ being emitted.

Average cost savings per vehicle per year on country basis range based on the available Webfleet regional data.

FX rate used is €1 - £0,85346. Currency from 06/06/2022

KM to miles is 1Km - 0,62137 mi
